

Scenarios

Scenario 1: Sofia improves her leadership with Ad-Astra

Sofia is a software engineering student who wants to improve her leadership skills to better prepare herself for the working world. She has tried various methods, such as courses and workshops, but feels that they do not prepare her to apply what she has learned in real situations.

One day, a friend recommends Ad-Astra, a platform that trains soft skills through practical experiences. Sofia downloads the app and chooses the Leadership Challenge, which simulates managing a team in a university project.

During the first challenge, Sofia must assign tasks to virtual colleagues with different personalities and skills. She makes a mistake by overloading one team member, which affects the group's performance. Ad-Astra provides her with immediate feedback and tips on effective delegation.

As she progresses through the challenges, Sofia learns how to motivate her team, manage conflict and communicate better. After completing the module, she feels more confident in her leadership abilities and begins to apply what she has learned to her team at the university.

Weeks later, in an interview for an internship, Sofia highlights how Ad-Astra helped her improve her leadership. The interviewer is impressed with her ability to reflect on her learning and offers her the opportunity to join the team.

Scenario 2: José Eduardo transforms his shyness into confidence with Ad-Astra

José Eduardo, a 21-year-old computer science student, has always preferred to learn at his own pace. Although he is technically proficient, his introverted nature makes it difficult for him to start conversations and participate in networking activities. One day, while exploring online self-learning options, he discovers Ad-Astra, a platform designed to train soft skills through practical, personalized exercises.

Upon entering the platform, José Eduardo chooses the “Assertive Communication” module. This module is set in virtual scenarios that simulate job interviews and team meetings, allowing him to practice without the pressure of the real environment. During his first exercise, he is faced with a simulated situation in which he must present himself to a virtual mentor and answer unexpected questions. Although he feels nervous at first, Ad-Astra’s intuitive interface gives him immediate feedback and allows him to repeat the exercise until he gains confidence.

With each session, José Eduardo notices small advances: his answers are more fluid, his tone becomes more confident and, little by little, he is encouraged to participate in moderated discussion forums within the platform. Thanks to this controlled environment, he begins to apply what he has learned in small group meetings at his university, where he feels supported and recognized for his contributions.

At the end of the module, José Eduardo has not only improved his ability to communicate, but has also reduced his insecurity when interacting in social environments. This progress opens up new opportunities for him, such as participating in collaborative projects and attending networking events, marking the beginning of his personal and professional transformation with the support of Ad-Astra.
